- Reproductive Sciences

The Birthplace is known for its excellent patient care, with a focus on providing a comfortable and safe environment for expectant mothers and their babies. The hospital has a dedicated team of obstetricians and gynaecologists who are highly trained in the latest procedures and technologies.

Injuries of the knee:

ACL tears

ACL (Anterior Cruciate Ligament) is a ligament in the knee that acts to control and stabilise the movement of the knee. ACL injuries are common, especially in sports involving sudden stops and changes in direction such as football, basketball, and soccer. The symptoms of an ACL tear are:

- Pain
- Swelling
- Instability
- Difficulty walking

ACL tears usually require surgery, but some minor tears may be treated with rest and physical therapy. The goal of ACL reconstruction is to restore the stability of the knee and allow the patient to return to their previous level of activity.
